141:158588 Treated titanium black, treated titanium black dispersions, and chemical compounds for titanium black treatment. Ito, Kazunori; Kitaoka, Naoyuki; Nabeta, Tomohiro (Sakata Inx Corp., Japan). Jpn. Kokai Tokkyo Koho JP 2004217885 A2 20040805, 27 pp. (Japanese). CODEN: JKXXAF. APPLICATION: JP 2003-278647 20030723. PRIORITY: JP 2002-379329 20021227.
- AB The present invention relates to treated titanium black obtained by treating the titanium black surfaces with carbodiimide compds. with ≥ 1 carbodiimide group and carbodiimide equiv. 100-50,000. Thus, 316 parts isocyanate group-contg. polycarbodiimide with carbodiimide

equiv., 115.7 parts poly(3-methylpentyladipate) diol 115.7, and 16 mg tetra-Bu titanate were heated at 100° for 5 h, 84.6 parts polycaprolactone having terminal carboxylic acid groups was added therein and reacted at 80° for 2 h, 375.5 parts propylene glycol monomethyl ether acetate was added therein to give a 40%-solids **carbodiimide** compd. with no. av. mol. wt. 4200 and **carbodiimide** equiv. 1583, 50 g amorphous silica-coated Titanium Black 13R was dispersed in 450 g water, 15 g of the resulting **carbodiimide** compd. soln. and 170 g propylene glycol monomethyl ether acetate were added therein and reacted at 90° for 8 h, dried at 80° for 2 h to give surface-treated titanium black, 48.0 parts of which was mixed with 52.0 parts propylene glycol monomethyl ether acetate, 35.0 parts the resulting dispersion was mixed with 30.0 parts a polyurethane varnish and 35.0 parts a mixed solvent, showing good dispersion stability and elec. resistance $\geq 10^{13}$ for a printing ink film.

20020625.

AB A treated **pigment** having satisfactory dispersibility in a dispersion
medium and flowability can be obtained even from a **pigment** having, on
the surface, no functional group reactive with a **carbodiimide** group.
The treated **pigment** is used in a dispersion compn. and also in a
resist compn. which has excellent developing characteristics when
used in forming a pattern, e.g., a **color** filter or black matrix,
therefrom. Also provided is a compd. for **pigment** treatment which is
suitable for producing the treated **pigment**. The treated **pigment** is
obtained by treating a **pigment** with a **carbodiimide** compd. having ≥ 1
side chains (e.g., a **polyester side chain**, **polyether side chain**,
polyacrylic side chain) and ≥ 1 basic nitrogen-contg. groups.

beads with fluorescent dendrimers: creation of localized microdomains. Cardona, Claudia M.; Jannach, Stephan H.; Huang, Hao; Itojima, Yukiko; Leblanc, Roger M.; Gawley, Robert E.; Baker, Gary A.; Brauns, Eric B. (Department of Chemistry, Freshwater Biomedical Sciences Center, University of Miami, Coral Gables, FL, 33124-0431, USA). Helvetica Chimica Acta, 85(10), 3532-3558 (English) 2002. CODEN: HCACAV. ISSN: 0018-019X. Publisher: Verlag Helvetica Chimica Acta.

- AB Second and third generation Newkome-type trifurcated dendrimers, contg. either a coumarin or dansyl fluorescent probe at the dendrimer core, have been synthesized and attached to ArgoGel solid-phase-synthesis beads. Subsequent reaction with rhodamine **dye** shows that the **dye** can penetrate throughout the beads to acylate the remaining sites. Thus, it is possible to achieve a spatially resolved microdomain for library formation at the core of the dendrimer, primarily on the bead's periphery, and a second microdomain suitable for derivatization by other reagents such as encoding tags and fluorescent sensors.

1058-725X. Publisher: Taylor & Francis Ltd..

AB The authors synthesized and evaluated NLO properties of azo **dye**
attached novel NLO polymers with high thermal stability. The NLO
polymers contg. an azo **dye**, DR-1, in their **side-chain** were
synthesized using a new approach. **Polyacrylic** acid or **polymethacrylic**
acid reacted with DR-1 via the intermediate reaction of the acid and
N,N'- **dicyclohexylcarbodiimide**. The DR-1 contents of the products
were 39 mol% and 29 mol%, for derivs. from **polyacrylic** acid and
polymethacrylic acid, resp. Glass transition temps. of 150° to 170°
were obtained for Disperse red 1 **dye** attached **polymethacrylic** acid.
The poled film exhibited 2nd order NLO susceptibilities ($\chi(2)_{33}$) of
48 pm/V to 53 pm/V at 1.3 μm fundamental wave. Due to the high glass
transition temps. of the polymers, long-term stability of the optical
nonlinearity at 100° was obsd. for 200 h or more. However residual
carboxyl groups caused absorbance decrease mainly by hydrolysis of
the ester bonds of the polymers. These polymers can be further
improved to have more thermally stable structure by heat treatment.
Through the approach, methacryl imide structure was formed and the
polymer has high Tg of 165°. This imidized polymer exhibited $\chi(2)_{33}$
of 45 pm/V at a wavelength of 1.3 μm and maintained .apprx.90% of the
initial value after 230 h or more at 100°.

AB The present invention recognizes that polymerizable coating films can
be utilized to make chips such as biochips that include channel
structures. These chips can optionally include one or more addnl.
structures such as particles, biol. groups or chem. groups. Such
biochips having channel structures have a wide variety of useful
applications, particularly in the field of lab. on a chip and other
applications where microfluidics are of importance. One aspect of
the present invention is a platform that includes: a surface, a
coating film and a channel structure. Preferably, the coating film
defines in part said channel structure and more preferably the
platform comprises a microchip. Diagrams describing the app.
assembly and operation are given.

136:63287 A novel contamination sensor in solution: the response of the electric resistance of a composite based on crystalline polymer-**grafted carbon black**. Tsubokawa, N.;

Tsuchida, M.; Chen, J.; Nakazawa, Y. (Department of Material Science and Technology, Faculty of Engineering, Niigata University, Niigata, 950-2181, Japan). Sensors and Actuators, B: Chemical, B79(2-3), 92-97 (English) **2001**. CODEN: SABCEB. ISSN: 0925-4005.

Publisher: Elsevier Science B.V..

AB The response of the elec. resistance of the composite prepd. from cryst. polymer-**grafted carbon black** as a function of the contamination in soln. was studied. The elec. resistance of the composite prepd. from poly(ϵ -caprolactone) (PCL)-**grafted carbon black** drastically increased in hexane, contg. chloroform, trichloroethane, and ethanol and returned immediately to the initial resistance when it was transferred into pure hexane. The response of the elec. resistance was highly reproducible. The logarithm of elec. resistance was linearly proportional to the concn. of chloroform in hexane. Also, the elec. resistance of the composite prepd. from cryst. poly(ethylene glycol) (PEG)-**grafted** and poly(ethylene adipate) (PEA)-**grafted carbon black** also drastically increased in hexane contg. alc., which is a good solvent of the **grafted** chain (PEG and PEA). This is due to a widening of the gaps between the **carbon black** particles based on the absorption of solvent for these cryst. polymers.

IT **24980-41-4D**, Poly(ϵ -caprolactone), **carbon black grafted** with **25248-42-4D**, Poly[oxy(1-oxo-1,6-hexanediyl)], **carbon black grafted** with

- AB Carbon black was grafted with poly(ethyleneimine) (I) and glycidyl
methacrylate-Me methacrylate copolymer (II). Carbon black grafted
with I gave a stable colloidal dispersion in water, but pptd. in
toluene. Carbon black grafted with I and II lost dispersibility in
water, but uniformly and stably dispersed in toluene. When carbon
black grafted with I and II was dispersed in a water-toluene binary
mixt., the water droplets (.apprx.1-3-mm diam.) were stabilized and
gathered in the interfacial layer. This result indicated that the
water droplets were surrounded by the particles in the same manner as
surfactant mols.

AB The compns. having good water resistance and storage stability comprise a carboxy-contg. water-based polymer (A) and a hydrophilically modified **polycarbodiimide** (B) which has alternating units of **carbodiimides** and alternating units of polyols linking to the previous units by urethane bondings and is terminated with hydrophilic units on 2 ends by urethane bondings. Thus, heating 700 parts 4,4-dicyclohexylmethane diisocyanate in the presence of 14 parts 3-methyl-1-phenyl-2-phospholene-1-oxide at 180° for 16 h, mixing 226.8 parts the resulting **polycarbodiimide** with 200 parts polypropylene glycol of Mn 2000 and heating at 90° for 3 h in the presence of 0.16 parts dibutyltin dilaurate gave an isocyanate-terminated copolymer which was modified with polyoxyethylene mono(2-ethylhexyl) ether to give a B-type copolymer. Mixing 80 parts a copolymer of Et acrylate 250, 2-hydroxyethyl methacrylate 150, 2-hydroxyethyl acrylate 223, methacrylic acid 77 and styrene 300 parts with 20 parts B and 10 parts **pigment** paste gave a compn. which could be thinned with water.

1999. CODEN: CATHE8. ISSN: 1054-8807. Publisher: Elsevier

Science Inc..

AB Prosthetic arterial **graft** surfaces are relatively thrombogenic and fail to heal with a cellular neointima. The goal of this study was to characterize the in vivo antithrombin properties of a novel Dacron surface with covalently linked recombinant hirudin (rHir) implanted in a canine thoracic aorta with high flow and shear rates. RHir was bound to a knitted Dacron patch using crosslinker-modified bovine serum albumin (BSA) as a basecoat protein. BSA was first reacted with the hetero-bifunctional crosslinker, sulfo-SMCC. This BSA-SMCC complex was then bound to the carboxylic acid groups of hydrolyzed Dacron patches using the **carbodiimide** crosslinker, 1-ethyl-3-(3-dimethylaminopropyl) **carbodiimide** hydrochloride. Iodinated, Traut's-modified rHir (125I-rHir-SH) was then reacted with the Dacron-BSA-SMCC surface, thereby covalently binding 125I-rHir. **Graft** segments were washed and sonicated to remove any nonspecifically bound 125I-rHir. Dacron-BSA-SMCC-S-125I-rHir patches (n = 5) and control Dacron-BSA patches (n = 5) were implanted in series in the thoracic aortas of canines. These patches were exposed to nonheparinized, arterial blood flow for 2 h. Patches were explanted and assessed for 125I-rHir loss. Antithrombin activity of explanted 1-cm² patch segments was evaluated using a **chromogenic** assay with 1, 5, 10, 15 units of added thrombin. Light microscopy was performed to qual. examine the pseudointima. Two animals were excluded from the study owing to excessive bleeding through the knitted 125I-rHir patch. Comparison of preoperative and postoperative 125I-rHir γ counts revealed an overall decrease of $20 \pm 5.4\%$ over the period studied. Explanted 125I-rHir patch segments were able to inhibit 1, 5, and 7 NIHU of thrombin, demonstrating retained antithrombin activity. Gross and microscopic examn. of the control and test Dacron surfaces showed marked differences. Dacron surfaces with covalently bound 125I-rHir had no gross thrombus and a thin pseudointima of platelets and plasma proteins. In contrast, the control patches had a thick pseudointima composed of fibrin rich thrombus. RHir, covalently bound to Dacron patches, maintains its biol. activity as well as prevents thrombus formation on the **graft** surface. This novel antithrombin coating, by modifying the blood/**graft** interface, may improve both short- and long-term patency in small-diam. prosthetic arterial **grafts** and has applications with respect to other implantable or indwelling biomaterials.

L30 ANSWER 16 OF 24 HCA COPYRIGHT 2006 ACS on STN

130:325734 A novel gas sensor from crystalline polymer-**grafted**

carbon black. Responsibility of electric resistance of composite from crystalline polymer-**grafted carbon black** against solvent vapor. Tsubokawa, Norio; Shirai, Yukio; Okazaki, Masaki; Maruyama, Kiyotaka (Department Material Science Technology, Faculty Engineering, Niigata University, Niigata, 950, Japan). Polymer Bulletin (Berlin), 42(4), 425-431 (English) **1999**. CODEN: POBUDR. ISSN: 0170-0839. Publisher: Springer-Verlag.

AB Cryst. polymers, such as poly(ϵ -caprolactone) (PCL), poly(ethylene adipate) (PEA), and polyethylene (PE), were successfully **grafted** onto **carbon black** surface by direct condensation of terminal groups of these polymers with carboxyl groups on the surface using N,N'-**dicyclohexylcarbodiimide** as a condensing agent. The elec. resistance of a composite prepd. from these cryst. polymer- **grafted carbon black** drastically increased to 104-105 times of initial resistance in good solvent vapor of **grafted** polymer and returned to initial resistance when it was transferred into dry air. However, the change of elec. resistance of the composite hardly obsd. in poor solvent vapor. These results suggest that these composite can be applied as a novel gas sensor.

127:39703 Covalent linkage of recombinant hirudin to poly(ethylene terephthalate) (Dacron): creation of a novel antithrombin surface. Phaneuf, Matthew D.; Berceli, Scott A.; Bide, Martin J.; Quist, William C.; LoGerfo, Frank W. (Vascular Surgery Research, Deaconess Hospital/Harvard Medical School, Boston, MA, 02215, USA). Biomaterials, 18(10), 755-765 (English) **1997**. CODEN: BIMADU. ISSN: 0142-9612. Publisher: Elsevier.

AB Thrombus formation and intimal hyperplasia on the surface of implantable biomaterials such as poly(ethylene terephthalate) (Dacron) vascular **grafts** are major concerns when utilizing these materials in the clin. setting. Thrombin, a pivotal enzyme in the blood coagulation cascade primarily responsible for thrombus formation and smooth muscle cell activation, has been the target of numerous strategies to prevent this phenomenon from occurring. The purpose of this study was to covalently immobilize the potent, specific antithrombin agent recombinant hirudin (rHir) to a modified Dacron surface and characterize the in vitro efficacy of thrombin inhibition by this novel biomaterial surface. Bovine serum albumin (BSA), which was selected as the 'basecoat' protein was reacted with various molar ratios of the crosslinker sulfosuccinimidyl 4-(N-maleimidomethyl) cyclohexane-1-carboxylate (sulfo-SMCC; 1:5-1:50). These BSA-SMCC complexes were then covalently linked to sodium hydroxide-hydrolyzed Dacron (HD) segments via the cross-linker 1-ethyl-3-(3-dimethylamino-propyl) **carbodiimide** hydrochloride (EDC). Covalent linkage of these complexes to HD (HD-BSA-SMCC) was not affected by any of the sulfo-SMCC cross-linker ratios assayed. rHir, which as initially reacted with 2-iminothiolane hydrochloride (Traut's reagent) in order to create sulphydryl groups, was then covalently bound to these HD-BSA-SMCC surfaces (HD-BSA-SMCC-S-rHir). The 1:50 (BSA:sulfo-SMCC) HD-BSA-SMCC-S-rHir segments bound 22-fold more rHir (111 bg over ng

/Dacron) compared to control segments and also possessed the greatest thrombin inhibition of the segments evaluated using a **chromogenic** substrate assay for thrombin. Further characterization of the HD-BSA-SMCC-S-rHir segments demonstrated that max. thrombin inhibition was 20.43 NIHU, 14.6-fold greater inhibition than control segments (1.4 NIHU). Thrombin inhibition results were confirmed by ¹²⁵I-thrombin binding expts., which demonstrated that the 1:50 HD-BSA-SMCC-S-rHir segments was also significantly less than the control segments. Thus, these results demonstrate that rHir can be covalently bound to a clin. utilized biomaterial (Dacron) while still maintaining its ability to bind and inhibit thrombin.

124:298767 Surface modification of polyetherurethaneureas and their antithrombogenicity. Kang, I.-K.; Kwon, O. H.; Byun, K. H.; Kim, Y. H. (Dep. Polymer Sci., Kyungpook Natl. Univ., Taegu, 702, S. Korea). Journal of Materials Science: Materials in Medicine, 7(3), 135-40 (English) 1996. CODEN: JSMMEL. ISSN: 0957-4530. Publisher: Chapman & Hall.

AB Polyetherurethaneurea (PU) films were treated by oxygen plasma discharge followed by acrylic acid (AA) **grafting**. The carboxyl groups of the AA-**grafted** PU (PU-AA) surface were coupled with bovine serum albumin and heparin via water sol. **carbodiimide**. Surface characterization of the modified PUs was carried out by attenuated total reflection Fourier transform IR (ATR-FTIR) spectroscopy and electron spectroscopy for chem. anal. (ESCA). The amt. of immobilized albumin (AL) and heparin (HE) on the PU surface was 1.8 and 1.5 µg/cm², resp., as detd. by the **dye** interaction method. Interactions between the surface-modified PUs and blood components such as plasma proteins and platelets were investigated to evaluate the blood compatibility of the samples. Plasma recalcification time (PRT) and activated partial thromboplastin time (APTT) of the albumin-immobilized PU (PU-AL) were almost the same as those of PU, while platelets were less adhered on the PU-Al than on PU. On the other hand, PRT and APTT of the PU-HE were significantly longer than those of the PU, PU-AA, and PU-AL. Moreover, adhesion of platelets was effectively suppressed on the PU-HE, leading to good in vitro blood compatibility.

Niigata, 950-21, Japan). Reactive & Functional Polymers, 27(1),
75-81 (English) 1995. CODEN: RFPOF6. ISSN: 1381-5148.
Publisher: Elsevier.
- AB **Grafting** of polymers onto **carbon black** [Neospectra II, Columbian
Carbon Co.; **channel black** FW 200, Degussa A.G.; furnace black
Philblack O, Phillips Petroleum Co.] surfaces was carried out by
direct condensation of surface carboxyl groups with functional
polymers. The reaction of surface carboxyl groups with functional
polymers having hydroxyl or amino groups proceeded readily in the
presence of N,N'-dicyclohexyl-**carbodiimide** (DCC) as condensing agent
at 30° and the corresponding polymers were **grafted** onto **carbon black**
surface with ester or amide bonds. The percentage of **grafting** of
diol poly(propylene oxide) (PPG Mn = 2.0 + 103) and diamine-type
poly(dimethylsiloxane) (SDA: Mn = 1.7 + 103) was 24.5 and 40.2%,
resp. No **grafting** reaction onto **carbon black** surface, however, was
obsd. in the absence of DCC. The percentage of **grafting** increased
with increasing carboxyl group content of **carbon black** and increasing
reaction temp. The percentage of **grafting** and the no. of **grafted**
polymer chains decreased with increasing mol. wt. of functional
polymers, because the reaction of surface carboxyl groups was
inhibited by the already **grafted** polymer chains. The polymer-**grafted**
carbon black gave a stable colloidal dispersion in a suitable solvent
for the **grafted** polymer.

122:189197 Surface modification of carbon microbead by the **grafting** of polymers. Tsubokawa, Norio; Hayashi, Shinji (Faculty Engineering, Niigata University, Niigata, 950-21, Japan). Journal of Macromolecular Science, Pure and Applied Chemistry, A32(3), 525-35 (English) 1995. CODEN: JSPCE6. ISSN: 1060-1325. Publisher: Dekker.

AB The surface **grafting** of polymers onto carbon microbead, sphere of carbonized phenol resin, was achieved by two methods: (1) the radical **graft** polymn. initiated by azo groups introduced onto the surface and (2) the trapping of polymer radicals by a carbon microbead surface. The introduction of azo groups onto a carbon microbead surface was achieved by the reaction of surface carboxyl groups on the bead with 2,2'-azobis[2-(hydroxymethyl)- propionitrile] using N,N'-**dicyclohexylcarbodiimide** as a condensing agent. The radical polymn. of Me methacrylate was initiated by surface azo groups introduced onto the surface, and PMMA was **grafted** onto the bead through the propagation of polymer chains from the surface: the percentage of **grafting** reached to 18% after 16 h. Furthermore, it was found that by the reaction of an azo polyamide (a polyamide having an azo bond in the main chain) and peroxide polymers (polymers having peroxide groups in the main chain and/or **pendant** group) with carbon microbead at 70-110°, polymer radicals formed by the thermal decompn. of these azo and peroxide polymers gave the corresponding polymer-**grafted** carbon microbead. The percentage of **grafting** decreased with increasing mol. wt. of the polymer radicals. The reactivity of surface functional groups and polycondensed arom. rings on carbon microbead are analogous with those of a **carbon black** surface.

119:161523 **Grafting** of a functionalized **side-chain** liquid-crystal polymer on carbon fiber surfaces: novel coupling agents for fiber/polymer matrix composites. Le Bonheur, Vassoudevane; Stupp, Samuel I. (Dep. Mater. Sci. Eng., Univ. Illinois, Urbana, IL, 61801, USA). Chemistry of Materials, 5(9), 1287-92 (English) 1993. CODEN: CMATEX. ISSN: 0897-4756.

AB Covalent **grafting** to functionalized carbon fibers of a specially designed liq.-cryst. monomer and its corresponding **side-chain** liq.-cryst. polymer contg. **pendant** chem. functions on their mesogenic groups was studied. From a materials point of view these liq.-cryst. compds. could act as coupling agents as fiber/polymer matrix interfaces, offering a mechanism to control composite properties not only through bonding but also through their spontaneous mol. orientation in interfacial regions. The **grafting** methodol. for both monomer and polymer to fiber surfaces involved esterification through **carbodiimide** chem. in soln. Carboxylic acid groups found on functionalized carbon fiber surfaces were esterified to phenolic functions in the **side chains** of the exptl. polymer. Following **grafting** procedures the fibers were analyzed by SEM and by contact angle measurements. SEM micrographs of fibers **grafted** with polymer revealed the presence of strongly attached polymeric material on the **graphitic** surface after rigorous extn. with polymer solvent. Contact angle measurements and polar/dispersive free energy anal. indicated also a smaller polar component of the surface free energy of fibers possibly due to the hydrophobic polymer backbone **grafted** on the carbon surfaces. The esterification reaction **grafted** the polyphenolic liq.-crystal polymer on **graphite** fiber surfaces.

114:118095 Process for covalent surface modification of hydrophobic
polymers and affinity membranes made therefrom. Azad, A. R. M.;
Goffe, Randal A. (Sepracor, Inc., USA). PCT Int. Appl. WO 9004609

A1 19900503, 145 pp. DESIGNATED STATES: W: AU, BB, BG, BR, DK, FI, HU, JP, KR, LK, MC, MG, MW, NO, RO, SD, SU; RW: AT, BE, BF, BJ, CF, CG, CH, CM, DE, FR, GA, GB, IT, LU, ML, MR, NL, SE, SN, TD, TG. (English). CODEN: PIXXD2. APPLICATION: WO 1989-US4620 19891016. PRIORITY: US 1988-258406 19881017.

AB The title process comprises e.g. (1) contacting a hydrophobic polymer with a soln. of a 1st nonsolubilizing solvent and a linker for sufficient time to form a covalent bond between the linker for sufficient time to form a covalent bond between the linker and a functionalizable **side chain** of the hydrophobic polymer; (2) contacting the reacted polymer of 1 with a soln. of a 2nd nonsolubilizing solvent and a mammol. for sufficient time to covalently bind the macromol. to the covalently bonded linker moiety. The above product may then be reacted with a reagent capable of producing active sites on the covalently bonded macromol., followed by reaction the produced active sites with a ligand. The process is conveniently carried out under heterogeneous conditions and proceeds with without a significant redn. in microporous membrane pore dimensions or hydraulic permeability of the original unmodified membrane. Also provided are a 4-component dope compn. and a spinnerette assembly useful for the manuf. of the polymers of the invention. Thus, **poly(ether sulfone)/poly(ethylene oxide)** hollow fiber membranes were prepd., treated with ethylene glycol diglycidyl ether, and then reacted with hydroxyethyl cellulose. The resulting fibers were activated with 2-fluoro-1-methylpyridinium p-toluenesulfonate and then reacted with antibodies to blood coagulation factor VIII. The resulting affinity membrane was used to purify factor VIII 115-fold from a factor VIII conc. Details of manuf. of the polymers of the invention are given, as are schematic diagrams of the spinnerette assembly.

- L30 ANSWER 24 OF 24 HCA COPYRIGHT 2006 ACS on STN
 108:114377 Manufacture of fire- and chemically resistant elastomer
 compositions. Corish, Patrick Joseph; Ohbi, Daljit Singh (BICC PLC,
 UK). Eur. Pat. Appl. EP 251792 A2 **19880107**, 10 pp.
 DESIGNATED STATES: R: AT, BE, CH, DE, ES, FR, GB, GR, IT, LI, LU,
 NL, SE. (English). CODEN: EPXXDW. APPLICATION: EP 1987-305854
 19870701. PRIORITY: GB 1986-16136 19860702.
- AB Halogen-free, fire-resistant, radiation-curable elastomeric compns.,
 resistant to seawater, hydrocarbon oils, and hydraulic fluids, useful
 as elec. insulators for cables, comprise oil-resistant **pigmented
 polyester-polyether** and/or polyamide-**polyether** thermoplastic
 elastomers, nitrile rubber, optionally ≤ 1 part other diene or acrylic
 rubbers per 3 parts nitrile rubber, and $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$. The nitrile
 rubber has a hydrocarbon main chain having ≤ 2 (epoxidized) double
 bonds per 5 C atoms, ≤ 1 CN **side chains** per 22 C atoms, and ≤ 1 hetero
side chain per 4 C atoms (with $\geq 70\%$ of the **side chains** being CN).
 The thermoplastic elastomer constitutes 10-70% of the total elastomer

content, and the $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ content is enough to give an O index ≥ 25 but ≤ 2 times the total elastomer content. Thus, Hytrel 4056 (segmented **polyester-polyether** thermoplastic elastomer) 36, Chemigum NX 775 (carboxylated nitrile rubber) 60, Hydral 710B ($\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$) 120, Hytrel 10 MS (master batch of **polycarbodiimide** in Hytrel) 4, SRF Black 10, 50% Silane A 172 4, Kemgard 911A (smoke suppressant) 4, 70% triallyl cyanurate 4, Dythal (Pb phthalate paste) 6, Monoplas 530 (plasticizer) 10, and Agerite Resin D 2 parts were mixed in 2 stages in a Banbury mixer, dumped, sheeted off, and cured by electron beam irradiation (dosage 175 kGy) to give specimens showing tensile strength 10.8 MPa, 100% modulus 9.6 MPa, elongation 250%, tear strength 5.6 MPa/mm, K factor insulation resistance 0.1 $\text{M}\Omega/\text{km}$, and O index 30.5. When cured samples were exposed for 28 days to diesel fuel at 20°, hydraulic fluid OX-38 at 50°, and deionized H_2O at 50°, they showed vol. swelling 8.4%, 6.3%, and 11%, resp., tensile strength retention 90%, 102%, and 73%, resp., and elongation retention 95%, 95%, and 103%, resp.
